Installation Instructions

1. Choose the window you want the Car Whiz mounted on. Partly open the window and hook the Car Whiz on the window with one end and insert it onto the window frame of the vertical glass edge.
2. Insert the safety belt onto the other end of the Car Whiz to the length of about 2-3 cm. Hook the Car Whiz and belt assembly onto the glass and extend to the whole length of glass top.
3. Cut off the additional length of the safety belt and shape it to end profile of the window frame.
Fix the safety belt with the supplied adhesive foam strips mounted on the top of the glass. Slowly close the window, until the top of Car Whiz safety belt slots into the upper frame of the window- be sure not to leave any gap at both ends.
4. Connect the lead wire from Car Whiz through the sun-shield to the lead wire of solar panel with each terminal connector. Leave about 15–20 cm of wire before going through the supplied wire tie unit to give room for strain of the wire when the door is opened. Use the supplied wire ties to fit the lead wire on the top of the frame of the window. Hide the excess wire at the back of sun-shield.
5. Attach the solar panel with the anti-slip pads on the back to your dashboard with the solar cells side facing the direction with the most optimum sun exposure. When the sunlight hits the solar panel, the fan will rotate in a clockwise direction and your installation is complete.
